

## 9.3 Radians

Take a piece of string and cut it so that it is the length of 1 radius. Mark a starting point and measure how many radii it takes to go the full circumference. Record your answer below.

# of radii 6.28

The exact number of radii is  $2\pi$

**Arc length:** the distance between 2 points on the circumference of a circle

**Radian:** another unit for angles

$$\theta = \frac{\text{arc length}}{\text{radius}}$$

↑  
in radians

\* Put the unit where you want to end up on top

Convert radians to degrees

multiply by  
 $180^\circ$   
-----  
 $\pi$  radians

Convert degrees to radians

multiply by  
 $\pi$  radians  
-----  
 $180^\circ$

# EXAMPLE

Convert each degree measure to radians. Leave your answer in reduced fraction form. with  $\pi$  (NO decimals!)

A.  $\frac{225^\circ}{1} \cdot \frac{\pi}{180^\circ}$

$$\frac{225\pi}{180} = \boxed{\frac{5\pi}{4}}$$

B.  $315^\circ \cdot \frac{\pi}{180^\circ}$

$$\boxed{\frac{7\pi}{4}}$$

C.  $300^\circ \cdot \frac{\pi}{180^\circ}$

$$\boxed{\frac{5\pi}{3}}$$

$\pi$  83/84

$$225 \div 180$$

# EXAMPLE

Convert each radian measure to degrees.

D.  $\frac{3\pi}{4}$  rad.  $\frac{180^\circ}{\pi \text{ rad}}$

$$\frac{3 \cdot 180^\circ}{4} = \boxed{135^\circ}$$

E.  $\frac{7\pi}{6}$   $\frac{180^\circ}{\pi}$

$$\boxed{210^\circ}$$

F.  $\frac{5\pi}{3}$   $\frac{180^\circ}{\pi}$

$$\boxed{300^\circ}$$

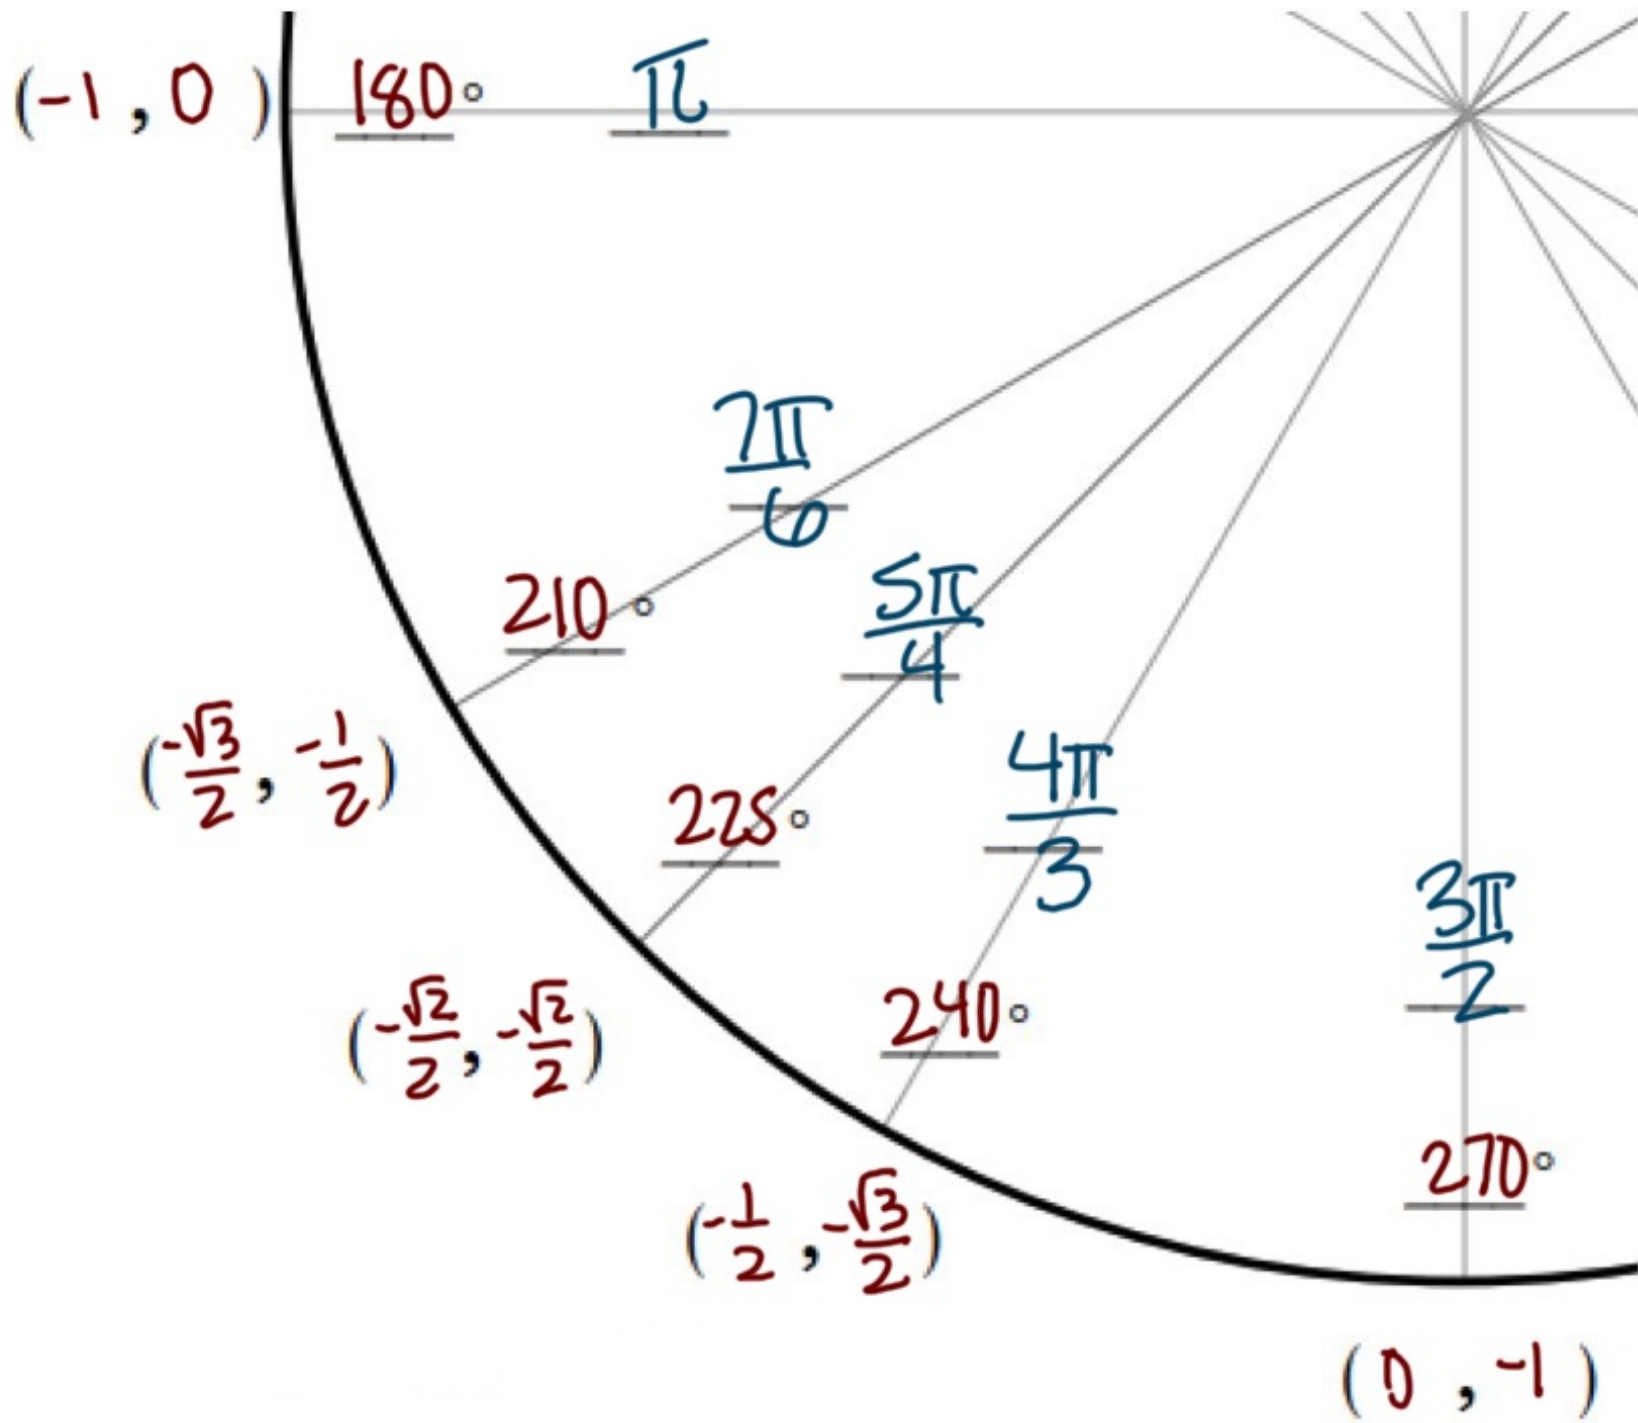

\*\*\* Go back to 9.2 notes and fill in the radian measure for each angle

$$\theta = \frac{\text{arc length}}{\text{radius}}$$

Radian

### Length of an intercepted arc:

For a circle with radius  $r$  and a central angle  $\theta$  (in radians), the length  $s$  of the intercepted arc is:

$$s = r \cdot \theta$$

(angle in radians)

arc length

# EXAMPLE

G. Find the length of  $s$ .

$$s = 3 \cdot \frac{5\pi}{6} = \frac{15\pi}{6} = 7.85 \text{ in}$$

H. Find the length of  $b$ .

$$b = 3 \cdot \frac{2\pi}{3}$$

I. Find the length of the missing piece of the circumference.
